Profile

Systems and Computing Engineering student (GPA 4.7/5.0) focused on backend and software architecture. I co-founded and build Resva, a multi-tenant SaaS in production; I was the architect for a microservices platform on Kubernetes and helped design a cloud-native platform on Azure.

Experience

Co-founder & CTO · TaoTek SAS · Resva (resva.digital) — Sep 2025 – present · Bogotá

- Built and launched end to end a multi-tenant booking SaaS for sports venues (Next.js, TypeScript, PostgreSQL/Supabase), now in production.
- Designed the backend as a modular monolith (31 domain services) and the PostgreSQL schema: 49 tables, exclusion constraints against overlapping bookings and row-level security (RLS) per location; rewriting the policies cut a read from 8 s to 23 ms.
- Guaranteed money integrity with atomic SQL functions that lock the row; concurrency tests verify that two simultaneous payments never overpay.
- Integrated Mercado Pago (OAuth 2.0, HMAC-signed webhooks with idempotency) and WhatsApp Business (verification codes and 24-hour reminders); per-IP rate limits and input validation.
- Build with AI agents and tests as the gate: 86 integration suites (API per role and browser) on GitHub Actions, staging and production environments, 32 decisions documented as ADRs.

`Next.js, React, TypeScript, PostgreSQL, Supabase, Mercado Pago, WhatsApp Business API, Vercel, GitHub Actions`

Projects

Sentinel · Cloud-native platform for theft alerts · UNAL diploma program, 2026 · team of 6

- Helped design the whole architecture (views, nine quality scenarios, cross-cutting decisions) on Azure: API Management, Container Apps, Event Grid, Service Bus, Azure SQL and Redis GEO.
- Built the notification microservice: peek-lock queue with dead-lettering, Firebase error classification and an atomic SQL upsert; alerts in 1.65 s and 0 failures across 3,624 reports with 50 concurrent users.

`Azure, Terraform (infrastructure as code), GitHub Actions, Azure SQL, Redis, Firebase Cloud Messaging`

RunPath · Microservices for running routes in Bogotá · UNAL Software Architecture, 2025-1 · team of 7

- Software architect for one of four iterations: defined the component-and-connector, deployment, decomposition and layered views.
- Applied API Gateway, reverse proxy with WAF, load balancing and replication across 5 segmented networks; JMeter exposed a ~28 s authentication bottleneck, solved with load-balanced replicas. Deployed on Kubernetes (GCP), handling 600+ concurrent users.

`Python/FastAPI, Node.js/NestJS, Java/Spring Boot, Kotlin, RabbitMQ, Docker, Kubernetes, GCP, Nginx`

Education

B.S. in Systems and Computing Engineering · Universidad Nacional de Colombia — Expected 2027
GPA 4.7/5.0

Diploma in Software Architecture and Quality · Universidad Nacional de Colombia — Aug – Dec 2026
Cloud-Based Software Engineering · Large-Scale Software Architecture · Software Quality

Technical skills

Languages	TypeScript, JavaScript, Python, SQL, C++; Java/Spring Boot (intermediate)
Backend & APIs	Node.js/NestJS, FastAPI, Flask, REST, OpenAPI, webhooks, OAuth 2.0
Data	PostgreSQL (schemas, migrations, RLS), Supabase, Redis, SQLite, Firestore
Architecture	Microservices, modular monolith, layered, API Gateway, broker, async messaging, ADRs
Cloud & DevOps	Azure, GCP, Vercel, Terraform, Docker, Kubernetes, GitHub Actions, Git Flow, Linux
Testing	pytest, integration and concurrency tests, Playwright, JMeter, Loki/Grafana
Frontend	React, Next.js, HTML, CSS
AI-assisted development	Claude Code and agents to implement, debug and review, with tests as the gate
Languages spoken	Spanish (native), English (C1)
Algorithms	Completed Blind 75 and 81 of a 150-problem list in Python, with complexity analysis
